Trees with Alternate Compound Leaves

Juglans sp.—Walnuts

Leaves are compound with no stalk attaching leaflets to central rachis. Black walnut does not have a terminal leaflet. English walnut does.

Walnut twigs have chambered pith.

Trees are broad with a very round crown, often as wide as they are tall. Trees tend to be medium to large.

Styphnolobium japonicum — Pagoda Tree

Leaflets attach to central rachis with short stalks. Leaflets flutter readily in the wind.

Panicles of white flowers bloom in late summer.

Tree is medium sized and round, with an open crown.

Gleditsia triacanthos—Honey Locust

Honey locusts have no terminal leaflet, unlike black locust (*Robinia*).

Bark is grey, thin, and furrows with age.

Form is upright with a broad crown and spreading branches, usually planted in parking lots or along walkways.
